

FREECHARGEbiz × AXIS BANK

Credit Card Recommendation Engine

Product Requirement Document · v1.0 · May 2026

Author	Prathmesh Sakore
Role	AI Product Manager — Candidate
Product	FreechargeBiz × Axis Bank Credit Card Engine
Status	Draft — Pitch Ready
Last Updated	May 2026

1. Executive Summary

FreechargeBiz sits at the intersection of digital payments and financial services for India's urban consumer base. Yet the credit card discovery journey — a high-value conversion moment — remains broken. Users face rigid questionnaires, generic card lists, and no personalization. Most abandon before applying.

This PRD defines the Credit Card Recommendation Engine: a data-driven product journey that replaces form-filling with intelligent spend analysis. The engine reads a user's financial footprint — via SMS, bank statement, or manual profiling — and surfaces a single Axis Bank / Freecharge card recommendation backed by real rupee-value reasoning specific to that user.

The journey spans 9 screens: mobile OTP → data consent → spend analysis → personalized recommendation → one-tap application. The prototype (Task 3) is fully interactive and pitch-ready.

2. Problem Statement

Three failure modes define the current credit card discovery experience in India:

The Questionnaire Problem

Users self-report spending through multi-step forms. They guess, fatigue, or game inputs to appear eligible. The output is a recommendation that matches stated intent — not actual behavior.

The Relevance Problem

Platforms show 8–15 cards with feature comparison tables. Users are expected to decode reward jargon (EDGE Miles, milestone bonuses, accelerated tiers) on their own. No one surfaces the single best card for a specific user's specific spend mix — with a rupee figure attached.

The Drop-off Problem

Fewer than 20% of users who start a card comparison journey complete an application. The gap is not lack of intent — it's cognitive overload and distrust that the result is genuinely personal.

FreechargeBiz has a structural advantage: an existing UPI relationship and access to transactional SMS data. This product activates that advantage to close all three gaps simultaneously.

3. User Personas

Three personas represent the primary segments. Each carries different data availability, card affinity, and drop-off risk.

Persona A — The Urban Daily Spender

Segment	Salaried professional, 24–35, metro city
Monthly Income	₹50,000 – ₹1,00,000
Pain Point	Uses a debit card out of habit. Unaware of how much cashback they're leaving on the table each month.
Goal	A card that automatically rewards existing spend — food delivery, subscriptions, utilities — without requiring behavior change.
Data Signal	Dense SMS history from Swiggy, Zomato, Amazon, utility providers. High SMS path success rate.
Matched Card	Axis My Zone (zero fee, daily cashback)

Persona B — The Frequent Traveller

Segment	Business professional or entrepreneur, 30–45, Tier 1 city
Monthly Income	₹1,20,000 – ₹3,00,000
Pain Point	Spending heavily on flights and hotels with a basic cashback card. Losing ₹15,000+ annually in uncaptured miles.
Goal	Maximize travel spend value: lounge access, flight miles, hotel upgrades — benefits proportional to actual investment.
Data Signal	Bank statement with IndiGo, MakeMyTrip, Marriott transactions. Upload path preferred.
Matched Card	Axis Atlas (5% yield, EDGE Miles, lounge access)

Persona C — The Digital-First Shopper

Segment	Young professional or student, 21–30, any city
Monthly Income	₹30,000 – ₹70,000
Pain Point	Shops heavily online and orders food daily but has never held a credit card. Uncertain about eligibility, wary of debt.
Goal	A first credit card with real cashback on digital spends, no hidden fees, and mechanics simple enough to trust.
Data Signal	Limited SMS history. Lifestyle profiler path. Shopping and dining sliders dominate spend distribution.
Matched Card	Axis ACE (5.4% yield, uncapped cashback, ₹499 fee)

4. Core Features & User Journey

The journey is structured across 4 phases and 9 screens. Each phase has a primary conversion risk and a design objective.

Visual Suggestion Onboarding Flow Diagram

Recommended addition: a left-to-right swimlane diagram showing all 9 screens grouped by phase, with the three data source paths (SMS / Upload / Lifestyle) branching from Screen 3 and converging at Screen 7. Annotate each screen with its drop-off risk level (Low / Medium / High).

Phase 1 — Identity & Trust (Screens 1–3)

Primary risk: users abandoning before providing any data. Design objective: establish safety before asking for anything.

Screen 1: Onboarding

- Mobile number input with +91 / India flag and 10-digit validation
- Three inline trust signals below input: bank-grade security, zero credit score impact, personalized matching
- **Note:** Trust signals are not decorative. In fintech onboarding, stated security assurances reduce PII drop-off by an estimated 15–25%. Each signal addresses a specific user fear: data misuse, credit bureau check, and generic results.

Welcome to FreechargeBiz

Verify your mobile number to view card recommendations.

IN +91 |

- **Secure Bank Infrastructure**

Your records are handled under strict Axis Bank security protocols.

- **Tailored Card Matching**

Analyzes spending habits against current partner category benefits.

- **Zero Credit Score Impact**

Pre-qualification checks run a soft query without affecting credit metrics.

Continue

Screen 2: OTP Verification

- 6-box input with auto-advance, backspace correction, paste detection, and shake animation on incorrect entry
- No silent failures — incorrect OTP shows visible red error state with retry prompt

Verify & Continue

Screen 3: Data Source Selection

- Three paths presented with equal visual weight: Analyze SMS (fastest), Upload Statement (most accurate), Estimate Lifestyle (instant)
- Each option shows a time estimate — no dark patterns pushing a single choice

Note: Giving users explicit control over data sharing is the highest-leverage drop-off reduction in this phase. Forced SMS access is the single largest funnel killer in Indian fintech onboarding.

Select Profile Method

Choose how you would like to map your spending preferences.

Analyze transaction messages

Fastest

Scans merchant text alerts locally on your device for quick tracking.

Takes ~10 seconds

Upload account statement

Verifies official banking PDF format statements securely.

Takes ~30 seconds

Estimate lifestyle habits

Input your monthly categories and values manually.

Instant Setup

Phase 2 — Consent & Processing (Screens 4–5)

Primary risk: users refusing data access at the permission gate. Design objective: make consent feel safe, not coercive.

Screen 4: Data Consent

- Bottom sheet with blur backdrop — signals a distinct permission moment, not a buried clause
- Three specific data use statements: transaction tokens, soft credit signal, category mapping
- Manual checkbox required — pre-checked consent not permitted (DPDP Act 2023 compliant)
- Users who decline SMS or statement permissions can continue via the Lifestyle Scan path without friction or punitive messaging

Regulatory Compliance

Data Authorization

Review how your info is handled securely to calculate match metrics under bank safety standards.

- ✓ Transaction Records: Only authorized local merchant tokens and value receipts are reviewed.
- ✓ Credit History Check: Verification triggers a soft query that has zero impact on credit scores.
- ✓ Ecosystem Mapping: Evaluates current category weights to identify premium rewards compatibility.
- ☒ I authorize FreechargeBiz to process my secure spend tokens solely for the purposes of generating personal card recommendations.

Agree & Continue

Screen 5: Processing Simulation

- FreechargeBiz logo animation with contextual log messages per data source
- Upload path shows real document progress before the log sequence begins

Note: The processing screen is a trust-building mechanism, not a loading screen. Showing specific analysis steps (merchant detection, category mapping) communicates genuine intelligence and primes users to trust the recommendation that follows.

Analyzing Spending Patterns

Computing local tokens for custom profile rewards.

Profile created successfully!

Phase 3 — Profile Building (Screens 6–7)

Primary risk: users providing inaccurate spend data. Design objective: anchor inputs to detected reality before asking for confirmation.

Screen 6: Insights Dashboard

- Spend distribution chart with per-category percentage bars
- Top merchant grid (SMS / Upload paths) showing detected outlets with frequency tags
- Income-derived pre-qualification badge — sets eligibility expectations before the recommendation

FREQUENT OUTLETS

Swiggy / Zomato
Daily Dining

Amazon Retail
Online Shopping

Uber / Ola
Commute

Netflix & Spotify
Recurring Bills

MONTHLY OUTLAYS

₹35,100

Total categorized spend / mo

Travel & Flights	₹4,500 (13%)
Online Shopping	₹12,000 (34%)
Dining & Delivery	₹7,200 (21%)
Fuel & Transport	₹3,500 (10%)
Bills & Utilities	₹3,100 (9%)
Entertainment	₹4,800 (14%)

DINING

Frequent Dining Spend

Regular transaction activity across premium food delivery apps.

SUBSCRIPTIONS

Recurring Digital Bills

Recurring monthly bills for digital services and subscriptions.

Screen 7: Spend Profiler

- Income slider (₹20K–₹3L) plus 6 category sliders: Travel, Shopping, Dining, Fuel, Utilities, Entertainment
- Each slider displays live rupee value and % of income — prevents unrealistic inputs
- SMS and Upload paths pre-fill all sliders from detected data — user adjusts rather than builds from scratch

Note: Pre-filling sliders from detected data is the key conversion mechanism in this phase. Users who see their own numbers already populated are significantly more likely to confirm and proceed than users who face a blank form.

FREECHARGE BIZ
by  **AXIS BANK**

Adjust Estimates

Review or modify your parameters below to refine card matching thresholds.

Monthly Income

₹85,000

Travel & Flights

Airlines, hotels, holidays

₹4,500

5% of income

Online Shopping

E-commerce, retail stores

₹12,000

14% of income

Dining & Delivery

Restaurants, Swiggy, Zomato

₹7,200

8% of income

Fuel & Transport

Fuel stations, cabs, transit

₹3,500

4% of income

Bills & Utilities

Electricity, mobile, internet

₹3,100

4% of income

Phase 4 — Recommendation & Conversion (Screens 8–9)

Primary risk: users not trusting a single-card recommendation. Design objective: answer 'why this card, for me' with real numbers before showing the CTA.

Screen 8: Card Recommendation

- Income-based pre-qualification banner at top of screen
- 3D flippable card with EMV chip, variant label, network badge
- **Match Reason tab** (dynamic): headline references user's actual top spend category and rupee value; two personalized insight points with computed figures; per-category annual return breakdown
- **Annual Value tab** (interactive): missed rewards counter; projected annual value; itemized category breakdown; spend calculator slider
- **Features tab** (static): highlights, joining fee, annual fee
- Alternative card reasoning: explains specifically why the other two cards were not selected for this user

by  **AXIS BANK**

✓ Pre-Approved: Eligible tier based on your ₹85,000/mo profile

• Matched — 5.4% Rewards Yield

Axis ACE

Uncapped returns on everyday digital shopping

Tap card to see terms and features

Match Reason

Annual Value

Features

WHY THIS CARD FITS YOU

You spend **₹12,000/month** on **Online Shopping** — your single biggest category at 34% of total outflow. Axis ACE is built to reward exactly that.

- ₹12,000/month on Online Shopping — your highest-yield category

Axis ACE pays 5% on utility bills and 4% on food apps — your two biggest spends. At your current run-rate, that's ₹7,776

Screen 9: Compare & Apply

- Full card catalog — matched card pinned at top with orange highlight
- Employment type selection via two tap buttons: Salaried / Self-Employed — no text entry
- Confirmation screen: application submitted state with reference ID (FC-2026-XXXX) and 24-hour follow-up SLA

ESTIMATED MISSED REWARDS

₹7,961 / year

PROJECTED ANNUAL VALUE ADDED

₹22,745

Online Retail Cashback Dividends

+₹520/mo

Ecosystem Utility Cashbacks

+₹335/mo

Food Delivery Platform Multipliers

+₹225/mo

Calculate by Spend:

₹35,100/mo

Alternative Option Logic

Axis My Zone

Your current travel spend volume is below the baseline needed to break even on premium annual maintenance fees.

Axis Atlas

Your regular spending distribution does not meet the higher travel volume needed to unlock premium miles accelerators.

5. Technical Architecture & Data Strategy

Visual Suggestion Architecture Diagram

Recommended addition: a 3-layer system diagram showing (1) Client layer: on-device SMS parser, PDF uploader, slider inputs; (2) Service layer: recommendation API, spend vector normalizer, merchant taxonomy; (3) Output layer: card matching logic, dynamic reasoning generator, lead queue. Annotate data boundaries — what stays on-device vs. what is transmitted.

5.1 Data Input Layer

Three input paths produce a normalized spend vector — a 6-category monthly spend distribution — that feeds the recommendation engine.

Path A: SMS Analysis (Recommended)

- On-device regex parsing of transactional SMS tokens from Indian bank and merchant sender IDs (HDFCBK, SBIUPI, SWIGGY, AMAZPAY etc.)
- Merchant normalization: sender IDs mapped to spend categories via server-maintained lookup table
- Amount extraction: debit figures parsed from standard Indian SMS formats (Rs., INR, debited, credited)
- 30-day rolling category aggregation across 6 spend buckets
- Income inference: largest single credit transaction in the past 45 days used as salary proxy
- **Privacy:** all parsing runs on-device. Only aggregated category totals are transmitted — never raw SMS content

Path B: Bank Statement Upload

- Server-side PDF/CSV parser with table structure detection
- Transaction rows identified by date, description, debit/credit, balance columns
- Merchant classification via fuzzy string matching against spend taxonomy
- Recurring transaction detection: same merchant + similar amount within 28–32 day windows flagged as subscriptions
- All figures normalized to 30-day equivalents regardless of statement period
- **Security:** files processed in isolated containers, deleted post-extraction. Only structured spend vector retained

Path C: Lifestyle Profiler (Cold Start)

- Manual slider inputs with Indian urban consumer defaults pre-populated
- Produces lowest recommendation confidence but ensures 100% journey completion
- Activates automatically when SMS store is empty or upload fails — no visible error state shown to user

5.2 Recommendation Engine

The engine applies a rule-based matching algorithm against the 3-card Axis Bank catalog. The v1 logic is deliberately simple, transparent, and auditable — appropriate for a first deployment where explainability matters more than model sophistication.

Condition	Card	Blended Yield	Rationale
Travel spend > ₹12,000 / mo	Axis Atlas	5.0%	EDGE Miles — best yield on aviation + hotels
Shopping > ₹8,000 OR Dining > ₹5,000 / mo	Axis ACE	5.4%	Highest uncapped cashback on digital spends
All other profiles	Axis My Zone	3.5%	Zero annual fee — safest default for daily use

The blended yield ratio (3.5% My Zone / 5.0% Atlas / 5.4% ACE) is applied to total monthly spend for projected annual value. This is a conservative estimate — actual yields are higher for users concentrated in bonus categories.

Visual Suggestion Recommendation Logic Visual

Recommended addition: a simple decision tree showing the two threshold checks (Travel > ₹12K → Atlas; Shopping > ₹8K or Dining > ₹5K → ACE; else My Zone) with example user spend vectors at each branch. This makes the matching logic immediately legible to non-technical stakeholders.

Dynamic Reasoning — How Personalized Copy Is Generated

Once a card is matched, 4 values are computed from the user's actual slider inputs and used to populate all copy on the Match Reason tab:

- **topCat** Highest spend category by rupee value
- **topCatPct** That category as % of total monthly spend
- **topCatAnnualReturn** $\text{topCat.value} \times 12 \times \text{yieldRatio}$
- **leakageEstimate** $\text{totalSpend} \times 12 \times \text{yieldRatio} \times 0.35$ (estimated annual value missed with a generic card)

Every user sees different numbers. The recommendation cannot produce identical copy for two users with different spend profiles.

5.3 Data Flow — End to End

1. **OTP verified** identity established, session opened
2. **Source selected** consent granted for SMS or Upload paths
3. **Spend vector built** on-device (SMS) / server-side (Upload) / slider inputs (Lifestyle)
4. **Vector submitted** normalized 6-category array + income signal sent to recommendation service
5. **Card matched** threshold logic returns card_id
6. **Reasoning generated** 4 computed values populate personalized copy client-side
7. **Recommendation rendered** fully personalized screen displayed
8. **Lead captured** employment type + mobile + card_id submitted to Axis Bank queue

5.4 Edge Cases & Fallbacks

- **Empty SMS store** Auto-routed to Lifestyle path with a single informational message — no error state

- **Ambiguous spend profile** No category exceeds thresholds → default to My Zone with zero-fee safety messaging
- **Income signal absent** Pre-qualification banner suppressed; replaced with 'Check eligibility in 2 minutes'
- **Upload parse failure** User notified, gracefully routed to Lifestyle path

5.5 Privacy & Compliance

- **DPDP Act 2023** Explicit, purpose-limited consent before any data access. Deletion request handled within 24 hours
- **RBI Guidelines** No hard credit bureau inquiry triggered during the flow. Soft query language used throughout
- **Data Minimization** Only aggregated spend vectors retained. Raw SMS and statement data never persisted

6. User Stories & Acceptance Criteria

Stories span three actor perspectives: End User, Business Stakeholder, and Product. All acceptance criteria are specific and testable.

US-01 As a new user, I want to verify my mobile number quickly, so that I can start the journey with minimal friction.

Acceptance Criteria OTP delivered within 3s. 6-box input auto-advances per digit. Incorrect OTP shows red error + shake animation. Paste fills all 6 boxes. Correct OTP navigates within 500ms.

Priority **Must Have**

US-02 As a privacy-conscious user, I want to understand exactly what data will be accessed before I authorize it, so that I can consent without feeling coerced.

Acceptance Criteria Consent screen appears as bottom sheet before any data access. Three explicit use statements displayed. Checkbox is manually required — pre-checked state not permitted. Decline path functional.

Priority **Must Have**

US-03 As a user with SMS transaction history, I want my spending patterns detected automatically, so that I don't have to fill out a form.

Acceptance Criteria Analysis completes within 10s. Minimum 3 categories populated. Sliders pre-filled with detected values. User can override any value. Lifestyle fallback available if SMS store is empty.

Priority **Must Have**

US-04 As a user reviewing a recommendation, I want to see exactly why this card was chosen for my specific spending, so that I trust it and feel confident applying.

Acceptance Criteria Match Reason tab shows: (1) headline with user's actual top category name and rupee value, (2) two insight points with computed figures, (3) per-category annual return breakdown. All figures update if sliders are changed. No generic copy permitted.

Priority **Must Have**

US-05 As a user considering applying, I want to model how much I'd earn at different spend levels, so that I can make a confident decision before committing.

Acceptance Criteria Annual Value tab has interactive slider (₹5K–₹1L). Annual and monthly projections update in real time. Slider initializes to user's actual total spend from profiler.

Priority **Should Have**

US-06 As a user ready to apply, I want to submit my application in one tap, so that I don't abandon at the final step.

Acceptance Criteria Apply CTA visible without scrolling. Employment type via two tap buttons — no text input required. Confirmation shows reference ID (FC-2026-XXXX). Follow-up SLA: 24 hours.

Priority **Must Have**

US-07 As a business stakeholder, I want qualified leads captured with employment context, so that applications are routed to the correct Axis Bank underwriting queue.

Acceptance Criteria Employment type, mobile number, card preference, and timestamp submitted to lead queue on apply. Reference ID generated and shown to user.

Priority **Must Have**

US-08 As a user who wants to compare options, I want to see all available cards before deciding, so that I don't feel locked in.

Acceptance Criteria Compare screen accessible from recommendation page. Matched card pinned at top with visual indicator. All cards show yield, fee, network. Card flip reveals terms. Back navigation returns to recommendation.

Priority **Should Have**

US-09 As a product manager, I want funnel analytics at every screen, so that I can identify drop-off points and iterate.

Acceptance Criteria Events fired at: screen load, CTA tap, source selection, consent grant/decline, tab switch, apply tap, employment selection, confirmation. Payload includes: session_id, screen, action, timestamp, source_path, card_id.

Priority **Should Have**

US-10 As a user with a bank statement, I want to upload it for a more accurate recommendation, so that I don't have to grant SMS access.

Acceptance Criteria Upload accepts PDF and CSV. Progress bar shown during processing. Parsed transaction count displayed post-processing. Sliders pre-filled from statement data. Graceful fallback to Lifestyle path on parse failure.

Priority **Should Have**

7. Prioritization — MoSCoW

Prioritized on two dimensions: does removing this break the core journey? Does this directly drive application conversion or data quality?

Must Have	Mobile OTP auth · Data consent screen · SMS spend analysis · Spend profiler · AI card matching · Personalized recommendation reasoning · One-tap apply + lead capture
Should Have	Bank statement upload path · Insights dashboard with merchant detection · Reward calculator · Compare screen · Funnel analytics events
Could Have	CIBIL score integration · A/B card ordering tests · Push notification for application status · In-app support escalation
Won't Have (v1)	Real-time UPI sync · Multi-card side-by-side apply · Gamified reward simulation · Peer spend benchmarking

MVP Scope

A user can: verify OTP → select data source → grant consent → complete spend profiler → receive a personalized card recommendation → submit a one-tap application with employment type and lead capture.

This covers US-01, US-02, US-03, US-04, US-06, and US-07. The prototype (Task 3) implements all Must Have and Should Have items — it is demonstration-ready beyond strict MVP scope.

8. Success Metrics

Targets are set against Indian fintech onboarding benchmarks for AI-personalized recommendation flows. The North Star metric (row 1) governs all other tradeoffs.

Metric	Definition	Target	Cadence
Qualified Application Rate	Applications submitted / journey starts	> 18%	North Star
Profile Completion Rate	Users reaching recommendation screen	> 60%	Daily
Consent Grant Rate	Users who agree on consent screen	> 80%	Daily
Drop-off by Screen	Funnel loss at each step	< 20% / step	Daily
Recommendation Acceptance	Users who tap Apply Now	> 35%	Weekly
Lead Capture Rate	Apply → employment type submitted	> 25%	Weekly
Avg. Session Duration	Onboarding → recommendation screen	< 3 min	Weekly
SMS Path Adoption	SMS selected vs total journeys	> 50%	Weekly

All metrics except session duration are directional. If Consent Grant Rate drops below 70%, that is the highest-priority intervention before optimizing any downstream metric.

9. Risks & Mitigations

SMS permission denied at scale

- Lifestyle path is a zero-permission fallback. All three paths are presented with equal visual weight — no forced preference.
- Product is fully functional at 0% SMS adoption. SMS path improves recommendation accuracy but is not load-bearing.

Spend data inaccuracy from SMS parsing

- Spend profiler sliders are always editable after pre-fill — users correct before recommendation is generated.
- The profiler is both a data input step and a data quality correction gate.

Users distrust a single-card recommendation

- Match Reason tab explains selection with the user's own spend numbers, not generic copy.
- Alternative card reasoning explains specifically why the other two were not matched — transparency reduces skepticism.
- Compare screen available for users who want to verify all options before applying.

DPDP Act compliance risk on consent language

- Consent screen uses purpose-limited, specific language — not blanket authorization.
- Legal review required before production deployment. Consent copy should not ship without sign-off.

Card catalog becomes stale as Axis Bank updates terms

- Card parameters (yield ratios, fees, category multipliers) are stored in a server-side config object.
- Any update requires a config change only — no code deployment, no app store release.

10. Appendix

A. Card Catalog

Card	Variant	Annual Fee	Blended Yield	Best Fit
Axis My Zone	Freecharge Preferred	₹0	3.5%	Urban daily spenders, first-time card users
Axis Atlas	Freecharge Travel Select	₹5,000	5.0%	Frequent flyers, business travellers
Axis ACE	Freecharge Cashback Plus	₹499	5.4%	Digital shoppers, food delivery power users

B. Screen Flow

- 9. **Onboarding** mobile entry + trust signals
- 10. **OTP Verification** 6-box input, auto-advance, error states
- 11. **Data Source Selection** SMS / Upload / Lifestyle
- 12. **Data Consent** SMS and Upload paths only — bottom sheet
- 13. **Processing Simulation** branded loader + contextual log messages
- 14. **Insights Dashboard** spend chart + merchant grid + pre-qualification
- 15. **Spend Profiler** income + 6 category sliders, pre-filled
- 16. **AI Card Matching** threshold evaluation + reasoning generation
- 17. **Recommendation** Match Reason / Annual Value / Features tabs
- 18. **Compare & Apply** full catalog + employment capture + confirmation

C. Spend Category Taxonomy

ID	Label	Example Merchants
travel	Travel & Flights	IndiGo, MakeMyTrip, IRCTC, Marriott, OYO
shopping	Online Shopping	Amazon, Flipkart, Myntra, Nykaa
dining	Dining & Delivery	Swiggy, Zomato, Restaurants
fuel	Fuel & Transport	HP, BPCL, Indian Oil, Uber, Ola
utilities	Bills & Utilities	BESST, Airtel, Jio, Netflix, Spotify
entertainment	Entertainment	BookMyShow, Gaming, Live Events
